the second edition of this best selling book remains the standard guide on concrete mix design amendments have been made to allow for changes in the terminology and materials used

basically the problem of designing a concrete mix consists of selecting the correct proportions of cement fine

and coarse aggregate and water to produce concrete having the specified properties sometimes additional ingredients such as ground granulated blastfurnace slag ggbfs pulverized fuel ash pfa or admixtures are used there are many properties of concrete that can be specified e g workability strength density thermal characteristics elastic modulus and durability requirements the properties most usually specified are the workability of the fresh concrete the compressive strength at a specified age and the durability by means of specifying the minimum cement content and or the maximum free water cement ratio and in some cases requiring the use of selected types of materials

this book focuses on the utilisation of construction waste material as coarse aggregate in making concrete it discusses in detail the behaviour of recycled aggregate under impact load along with other structural applications and explains the various quality improvement techniques for recycled aggregate and recycled aggregate concrete rac the first chapter describes the importance of recycling construction and demolition waste and the status quo of global construction and demolition waste recycling the second chapter examines the recycled aggregate production methodology subsequent chapters address the physical and mechanical characteristics and different research findings as well as the engineering properties of recycled aggregate concrete further the interrelationships among the mechanical properties of recycled aggregate concrete are discussed the book also explores long term properties like shrinkage and creep durability properties and microstructural characterisation it will serve as a valuable resource for researchers and professionals alike

cement is the basis of the building and construction industry and of fundamental importance for many civil engineering applications as such the cement industry is one of the key industries worldwide necessary for the current and future sustainable development of society despite its undisputed importance the cement industry is one of those industrial branches predominately responsible for high energy consumption and excessive generation of large amounts of carbon dioxide and other contaminants that significantly endanger human health and the environment and contributes to global warming in this context nanomaterials polymeric materials and natural additives are being used for cement enhancement in various applications this book examines these novel materials and their optimization characterization and sustainable application in the building industry and for stabilizing hazardous waste

original research on performance of materials under a wide variety of blasts impacts severe loading and firecritical information for protecting buildings and civil infrastructure against human attack deterioration and natural disasterstest and design data for new types of concrete steel and frp materials this technical book is devoted to the empirical and theoretical analysis of how structures and the materials constituting them perform under the extreme conditions of explosions fire and impact each of the 119 fully refereed presentations is published here for the first time and was selected because of its original contribution to the science and engineering of how materials bridges buildings tunnels and their components such as beams and pre stressed parts respond to potentially destructive forces emphasis is placed on translating empirical data to design recommendations for strengthening structures including strategies for fire and earthquake protection as well as blast mitigation technical details are provided on the development and behavior of new resistant materials including reinforcements especially for concrete steel and their composites

the digest describes the different ways in which concrete can be specified with particular reference to bs 5328 and to cp 110 it discusses the variability of concrete in production the requirements for quality control and the statistical aspects of testing for compliance with a specification it describes the main factors influencing the strength and workability of concrete in relation to the mix design method described in design of normal concrete mixes materials for concrete are described in digest 237 this digest replaces digest 13 which is now withdrawn

this project is carried out to study the effect of latex admixture on the behaviour of fresh and hardened concrete due to non destructive test ndt this report consists of information on the project theory material used experimental procedure the results obtained and their analysis four parameters will be examined and analysed in this study namely compressive strength ultrasonic upv rebound hammer and workability which is the main objective for this project the varying percentage for 0 5 and 15 of latex admixture in the concrete can be anticipated which is the optimum dosage that give satisfactory result in the four parameters the material used in this study are ordinary portland cement which comply with requirements of b s 12 20mm crushed granite river sand tap water and natural latex the latex are recommended and supplied by research institute of malaysia rrim the concrete mix was designed for 20 n mm<sup>2</sup> 30 n mm<sup>2</sup> and 40 n mm<sup>2</sup> compressive cube strength using

british doe mix design the water cement ratio is 0.35 by weight of cement for all the concrete specimen refer appx a 1 in conclusion the test indicate the workability of concrete increase with the percentage of latex admixture in addition the strength of concrete will be reduced due to the percentage of latex admixture but with an increase of concrete grade the strength of concrete increases from test conducted the latex admixture does not effect the concrete structure therefore the latex admixture does not effect the concrete density
